Description

Site Classifier - a system that allows telecom operators to organize sites into lists by category. This system is self-learning, it allows you to distribute sites in certain categories.

The module "Site Classifier" includes:

1. **"Site Classifier Server" (fastclsfr)** - this server performs the following functions: receiving the site text, categorizing sites using machine learning technologies, and also allows you to find out the percentage of recognition of a specific site text and the likely category in which site is placed.
2. **Interface dpiui2** - this module allows you to conveniently work with the "Site Classifier" by using a graphical interface.
